

Combined Cycle Power Plant Noroeste (Topolobampo II)

- According to CFE's growth forecast, energy demand in the Western region of Mexico will grow at an average of 4.8% annually.
- In order to meet the demand while maintaining regional reserve margins at the appropriate levels, it is planned to build the plant in Choacahui, in the Municipality of Ahome in the State of Sinaloa.
- The project will consist of a power plant with 887 MW of capacity under summer design conditions, under the Independent Power Producer (IPP) plan.
- The power plant could have the following configurations: (i) a module comprising three gas turbines, three heat exchangers and one steam turbine; or (ii) a module comprising two gas turbines, two heat exchangers and one steam turbine.

Project Details:

- The project includes the engineering, design and supply of all equipment and materials, as well as the spare parts and special tools. It also includes all tests and commissioning plus an electrical substation.
- The combined cycle will operate with natural gas, which will be provided by the CFE.
- The estimated project implementation period is 30 months.

Geographic location

State of Sinaloa
